SUB-THEME: AI & Data-Driven Farming

AI-Powered Smart Agriculture Assistant

Helping farmers with crops, soil, irrigation, pests and sustainable farming

Introduction

KrishiGPT is a web-based agricultural AI assistant.

Users can enter their city and ask farming-related questions.

The planned system combines AI with location-aware agricultural guidance.

The interface is designed to be simple and easy to use on a laptop.

Objective

To provide AI-based assistance for agriculture-related questions.

To help farmers with information about crops, soil, irrigation, pests, and diseases.

To provide location-aware guidance using the user's city.

To make agricultural information easily accessible

Farming-focused question box and Chat-style interaction.

KrishiGPT — Tech Stack

-  **Frontend:** HTML, CSS & JavaScript
 -  **Backend:** Python REST API
 -  **AI:** Open-source LLM (Gemma / GPT4All)
 -  **Weather:** Open-Meteo API
 -  **Hosting:** GitHub Pages/Cloudflare + Render
 -  **Core:** AI + real-time weather for sustainable farming guidance
-

Working

Step 1: User enters their city.

Step 2: User enters an agricultural question.

Step 3: The application searches the query by various AIs.

Step 5: The AI response can be displayed in the KrishiGPT interface.

Step 6: Weather and web information can be added for more contextual answers.

Features

Provide an easy-to-use farming assistant.

Accept natural-language questions from users.

Use the user's city for location-aware guidance.

Provide AI-generated answers to agricultural questions.

Create a foundation for adding weather and internet-based information

Impact

Make agricultural information easier to access.

Reduce the need to search multiple sources for basic guidance.

Support farmers with faster access to AI-assisted information.

Create a platform that can grow into a broader smart-agriculture system.

Conclusion

KrishiGPT combines a simple web interface with AI-based agricultural assistance.

The current frontend provides the foundation for the complete system.

Future integration with AI, weather and web data can make the assistant more useful and context-aware.

The project demonstrates how AI and web technology can support smart agriculture
